Hi, I'm scieny!

I was born and raised in China with my mother and my siblings. But when I finally stood on my own paws and roamed through the woods, I felt somehow lonely. I wanted to be more, to explore new things and to gain experience. I took all my courage together and left my homeland in search of more colour in my life - and I found it ...

I had already had a very long journey behind me - I had already come all the way to Germany - when I looked around a little in the city of Jena. There I finally discovered the company scienova. The name aroused my interest and I decided to just knock. At first the people there were very surprised to see a little Panda girl like me here, but when I explained my concern to them, they offered me to do an internship and get to know the company better. I accepted the offer enthusiastically and this internship finally turned into something long-term. Here I finally found a real home - in science. I admire people's ambition to explore new things and gain more knowledge. I'm also very enthusiastic about technology - when I first discovered VR glasses, I didn't even want to take them off. We all benefit from each other. I teach people not to get too hectic with all their thirst for knowledge and not to want to do everything at the same time. I often sit in the lab and nibble my bamboo shoots while looking over the shoulders of the employees and constantly learning new things.

Because I love science so much, my name is now scieny and I am very proud to represent scienova.
